Exercise 3b – Wireflow Prototype Design

AIM:

The aim of this exercise is to design a basic prototype using Wireflow that demonstrates the navigation flow between different screens such as Home Page, Menu Page, Profile Page, and Settings Page.

TOOLS USED:

- Wireflow (<https://wireflow.co/>)
- Basic UI design concepts

PROCEDURE:

Step 1: Planning the Prototype

- Identified the main screens required for the application:
 - Home Page
 - Menu Page
 - Profile Page
 - Settings Page
- Planned a simple and logical navigation flow between these screens.

Step 2: Creating Wireflow Project

- Logged into Wireflow platform.
- Created a new project for the prototype design.

Step 3: Designing Screens

1. Home Page

- Designed the main landing screen.
- Included basic layout elements such as image placeholder and text content.
- Added navigation direction to Menu Page.

2. Menu Page

- Created a layout displaying multiple options or items.
- Included visual placeholders for menu items.
- Linked Menu Page to Profile Page.

3. Profile Page

- Designed a user profile interface.
- Included profile image placeholder and user information layout.
- Connected Profile Page to Settings Page.

4. Settings Page

- Created settings interface with options layout.
- Added placeholders for settings controls and options.

Step 4: Linking Screens (Wireflow)

- Connected all screens using arrows to represent user navigation:
 - Home Page → Menu Page
 - Menu Page → Profile Page
 - Profile Page → Settings Page
- Ensured smooth and logical flow between pages.

RESULT:

A wireflow prototype was successfully created showing the navigation between Home, Menu, Profile, and Settings pages. The flow clearly represents how a user moves through the application step by step.

Conclusion:

The wireflow prototype successfully demonstrates a clear and simple navigation flow between different application screens.
